 ```
The invention relates to an isolated cytokine receptor polypeptide designated Ecytori8. The Zoyfori8 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhbit call proliferation associated with psoriasis or tumour growth The coll proliferation associated with psoriasis or tumour growth The chinques Zoyfori8 oilgouncleotide probes are useful for in the stay techniques. Zoyfori8 oilgouncleotide probes are useful for in the stay techniques. Zoyfori8 probes and primers can be used to detect and localize Zoyfori8 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in citrosome 3 in which captoris gene resides. The Zoyfori8 polymoriagides can also be used in linkage-based testing of pulmonary alvaolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with the pulmonary alvaolar sequence represents a fundaman Zoyfori8 amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to an isolated cytokine receptor polypeptide designated Scytori8. The Scytori8 polypeptides can be expressed by standard_recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psoriasis or tumour growth. The encoding nucleic acids are useful for providing Scytori8 in vivo by gene therapy techniques. Ecytori8 oligonucleotide probes are useful for the vivo diagnosis, and the Ecytori8 probes and primers can be used to detect and localize Ecytori8 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which Ecytori8 gene resides. The Ecytori8 polynucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial polynocial for fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a human Ecytori8 variant amino acid sequence.
                                                                                                                                                                                                                          New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 ligand and provided the second scytorial standard and second scytorial standard.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RTGMESOPFLNMKFETDYFVKVVPFPSIKNESNYHPFFFRTRACDLLLOPDNLACKPFWK 180

Ligand

The invention relates to an isolated cytokine receptor polypeptide designated Zcytozi8. The Zcytozi8 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psortasis or tumour growth. The encoding nucleic acids are useful for providing Zcytozi8 in vivo by gene therapy techniques. Zcytozi8 oligonucleotide probes are useful for in vivo diagnosis, and the Zcytozi8 probes and primers can be used to detect and localize Zcytozi8 gene expression in tissue samples. The probes are also useful for the detecting gross aberrations in chromosome 3 in which Zcytozi8 gene resides. The Zcytozi8 polynucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with human Zcytozi8 splice variant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes movel nucleic acids, encoding interleukin (IL) 17 receptor like polypepitides, useful as yaccines and in gene therapy. These have immunomedulatory anti-inflammatory, anti-diabetic, anti-microbial, immunosuppressive, heptic, anabolic, anorectic, anti-alzheimer's, renai anti-parkinsoinan, anti-ri-satimatic, dermatological, osteopathic, vascular, cotyulashi, anti-leukaemic, anti-infertility and ophthalmological activities. The IL-17 receptor like nucleic acids and proteins may be used to prevent and treat diseases associated with inappropriate IL-17 receptor like polypeptide (ILI/TIP) expression. These include, for example immune disorders (e.s. inflammation, diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                 Interleukin 17; hIL-17 receptor like protein; immunomodulatory; anti-inflammatory; anti-diabetic; immunosuppressive; anti-microbial; hepatic; anabolic; anorectic; anti-athelmer's; anti-parkinsonlan; anti-convulsant; anti-asthmatic; dermatological; reaal; osteopathic; vascular; cytostatic; anti-leukaemic; anti-infertility; ophthalmological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma

Internation describes unvert decines and in gene therapy: These internation describes useful as vaccines and in gene therapy: These have immunomodulatory, anti-inflammatory, anti-dabetic, anti-microbial, anti-parkinsonian, anti-onvulsant, anti-asthmatic, dermatological, anti-parkinsonian, anti-convulsant, anti-asthmatic, dermatological, anti-parkinsonian, anti-convulsant, anti-ostparic, anti-infertility and stepathic, vascular, cytostatic, anti-leukaemic, dermatological, osteopathic, vascular, cytostatic, anti-leukaemic, dermatological acids and proteins may be used to prevent and treat diseases associated with internal and creating in disperced include, for example immune disorders (e.g. inflammation, disbetes and contide, for example immune disorders (e.g. inflammation, disbetes and cytic, anti-parking disease and epilepy), weight disorders (e.g. osteoporosis and hypercatcaemia), vascular disorders (e.g. osteoporosis and hypercatcaemia), vascular disorders (e.g. stroke and etheroselerosis, cancers (e.g. lefertility and miscarriage), eye disorders (e.g. infertility and miscarriage), eye disorders (e.g. glaucoma and retinal meropathy). The DNA and itse complements may also used as dispense in the production of antiodes against the proteins and antagonists may also be used to every antigens in the production of antiodes against the proteins and antagonists may also be used to expression and artifity and miscariity and misc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: This sequence is not given in the specification but is based on the human Interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the invention describes novel nucleic acids encoding interleukin (IL) 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treatiby, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 20; Page -; 158pp; English.
                                                                                                                                               15-MAR-2001; 2001WO-US08678.

Sequence

The invention describes novel nucleic acids encoding interleukin (IL) 17
receptor like polypeptides useful as vaccines and in gene therapy. These
receptor like polypeptides useful as vaccines and in gene therapy. These
have immunomodulatory, anti-inflammatory, anti-diabetic, anti-alzheimer's, renal,
anti-parkinsonian, anti-convulsant, anti-sthmatic, dermatological,
anti-parkinsonian, anti-convulsant, anti-sthmatic, dermatological,
ophthalmological activities. The IL-17 receptor like nucleic acids and
proteins may be used to prevent and treat diseases associated with
proteins may be used to prevent and treat diseases associated with
containing the polypeptide (ILI/IL)p) expression. These
include, for example immune disorders (e.g. hepatitis and septicaemia),
cusping disorders (e.g. anorexia, cachexia and obesity), neuronal
dysfunction (e.g. Alzheimer's disease, Parkinson's disease and epilepsy),
und disorders (e.g. osteoprosis and hypercalcaemia), vascular disorders
confidences and atherosolesis, cancers (e.g. glomerulonephritis),
bone diseases (e.g. osteoprosis and hypercalcaemia), vascular disorders
confidences), reproductive disorders (e.g. infertility and
missarriage), eye, disorders (e.g. disorders (e.g. infertility and
missarriage), eye, disorders (e.g. disorders (e.g. infertility and
missarriage), eye disorders (e.g. disorders (e.g. infertility and
missarriage). miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The DNA and its complements may also used as disgnostic probes to detect and quantitate the presence of similar nucleic acids in samples and identify patients needing restorative therapy. The ILI77ip may also be used as antigens in the production of antibodies against the proteins and in

The invention describes novel nucleic acids encoding interleukin (IL) 17
receptor like polypeptides useful as vaccines and in gene therapy. These
receptor like polypeptides useful as vaccines and in gene therapy. These
have 'immunoadulatory, anti-inflammatory, anti-diabetic, anti-microbial,
fumunosuppressive, hepatic, anbolic, anti-alzheimer's, renal,
anti-parkinsonian, anti-anti-anti-anti-alti-alteriality and
correspondance of cytostatic, anti-leukaemic, anti-infertility and
ophthalmological activities; The:IL-17. receptor.like nucleic acids and
protedins may be used to prevent. and treat diseases associated with
propropriate IL-17. receptor like; polypeptide (ILI71p) expression. These
include; for example immune disorders (e.g. inflammation diabetes and
transplant rejection); infections (e.g. hepatitis and septicaemia),
weight disorders (e.g. Alzheimer's disease, Parkinson's disease and epilepsy),
cump disorders (e.g. osteoporosis and obpestly), neuronal
dysfunction (e.g. Alzheimer's disease, Parkinson's disease
(e.g. eczema and psoriasis); kidney disease (e.g. glomerulonephritis),
bone diseases (e.g. osteoporosis and hypercalcaemia), yasulua disorders
(e.g. eczema and atherosclerosis, cancers (e.g. infertility and
breast cancer), reproductive disorders (e.g. infertility and
miscarriage), eye disorders (e.g. infertility and distarriage), eye disorders (e.g. infertility and distarriage). eye disorders (e.g. infertility and distarriage), eye disorders (e.g. infertility and distarriage). eye disorders (e.g. infertility and distarriage). eye disorders (e.g. infertility and distarriage). eye disorders (e.g. infertility and distarriage).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                patients needing restorative therapy. The ILI7rip may also be used as antigens in the production of antibodies against the proteins and in assays to identify modulators of expression and activity. The anti-ILI7rip antibodies and antagonists may also be used to down regulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: This sequence is not given in the specification but is based on the human Interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 22.
                                              Nucleic: acids encoding interleukin 17 receptor like polypeptides, useful for preventing diagnosing and treating, e.g. leukemia, asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                62 ISQYACHDQVAVTILWSPGALGIRFLKGFRVILBELKSEGRQCQQLILKDPKQLNSSFKR 121

Human Interleukin 17 (hIL-17) receptor like protein substitution #7

Treceptor like polypeptides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial, than the immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial, immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial, immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial, immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial, osteopathic, vascular, cytostatic, anti-leukaemic, anti-infertility and ophthalmological activities. The III-Treceptor like muclaic acids and contents may be used to prevent and treat diseases associated with inappropriate II-Treceptor like polypeptide (ILITIP) expression. These include, for example immune disorders (e.g. inflammation, diabetes, and transplant rejection), infections (e.g. inflammation, diabetes, and dystunction (e.g. Alzhelmer's disease, Parkinson's disease and epilepsy), weight disorders (e.g. anorexia, cachexia and obesity), neuronal dysfunction (e.g. Alzhelmer's disease, Parkinson's disease and epilepsy), bune diseases (e.g. osteoporosis and hypercalcemia), vascular disorders (e.g. stroke and atherosclerosis, cancers (e.g. infertility and miscarinage), eye disorders (e.g. infertility and alsorders (e.g. antipens in the production of antibodies against the protection and activity. The anti-infilate production of antibodies against the protection and activity miscarinage and antagonists may also be used to down regulate expension and activity. Note: This sequence is not given in the specification but is based on the human Interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 23. The invention describes novel nucleic acids encoding interleukin (IL) 17

```

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-idabetic, anti-microbial, immunosuppressive, hepatic, anabolic, anorectic, anti-alzheimer's, renal, anti-iparkinsonian, anti-convulsant, anti-astimatic, dermaclogical, osteopathic, vascular, cytostatic anti-leukaemic, anti-infertility and ophthalmological activities. The IL-17 receptor like nucleic acids and proteins may be used to prevent and treat diseases associated with inappropriate IL-17 receptor like polypeptide (ILI)-Ip) expression. These include, for example immune disorders (e.g. inflammation, diabetes and

bone diseases (e.g. osteoporosis and hypercalcaemia), vascular disorders (e.g. stroke and atherosclerosis, cancers (e.g. leukemia, myeloma and breast cancer), reproductive disorders (e.g. infertility and miscarriage), eye disorders (e.g. glaucoma and retinal neuropathy). The DNA and its complements may also used as diagnostic probes to detect and quantitate the presence of similar nucleic acids in samples and identify patients needing restorative therapy. The ILI7rip may also be used as antigens in the production of antibodies against the proteins and in ussays to identify modulators of expression and activity. The anti-ILI7rip antibodies and antagonists may also be used to down regulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; Interleukin-17 receptor; IL-17RH4; agonist; antagonist; pR020005; DNA 154095-2998; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; diabetes mellitus; allergic disease; asthms; demyelinating disease; destams; demyelinating disease; descentiaginous disorder; transplantation associated disease.
                                                                                                                                                                                                     expression and activity.

Note: This sequence is not given in the specification but is based on the human interleukin 17 (II-II) receptor like protein sequence (AAU09904) and has been created according to information given in claim 19.

Agremic lupus erythematosia, Thematoid arthritis, Osteoarthritis, disperante lupus erythematosia, Thematoid arthritis, Osteoarthritis, divenile chronic arthritis, a spondyloarthropathy, systemic sclerosis, an idiopathic inflammatory myopathy, Sigaren's syndrome, systemic sclerosis, arcoidosis, autoimmune haemolyitic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune mediated renal disease, a demyelinating disease, an autoimmune or immune mediated skin disease, contact dermatitis, an aleasic disease of food hypersensitivity, asthma, a transplantation associated disease, or a chronic inflammatory demyelinating polyneuropathy. Treating a degenerative cartilaginous disorder comprises administering a PRO1031 or PRO1122 polypeptide agonist, or antagonist to the mammal. Numerous examples of the diseases and disorders are given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Interleukin 17; hIL-17 receptor like protein; immunomodulatory; anti-inflammatory; anti-diabetic; immunosuppressive; anti-microbial; hepatic; anabolic; ancectic; anti-larahemer's; anti-parkinsonlan; anti-oravulsant; anti-asthmatic; dermatological; renal; osteopathic; vascular; cytostatic; anti-leukaemic; anti-infertility; ophthalmological;
                                                are useful for treating a mammal with an immune related disease, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            66 ACHDOVAVTILWSPGALGIEFLKGFRVILEELKSEGROCOQLILKDPRQLNSSFKRTGME 125

The invention describes novel nucleic acids encoding interleukin (IL) 17

Treceptor like polypeptides useful as vaccines and in gene therapy. These
have immunomodulatory, anti-inflammatory, anti-diabetic, anti-inferrobial,
immunosuppressive, hepatic, anabolic, anti-diabetic, anti-inferrobial,
contemporation, anti-convulsant, anti-ast#matic, dermatological,
contemporation, anti-convulsant, anti-ast#matic, dermatological,
contemporation anti-convulsant, anti-ast#matic, dermatological,
contemporation anti-convulsant, anti-ast#matic, anti-inferrility and
proteins may be used to prevent and treat diseases associated with
proteins may be used to prevent and treat diseases associated with
contemporate IL-17 receptor like polypeptide (IL)71p) expression. These
include, for example immune disorders (e.g. inflammation, diabetes and
ctransplant rejection), infections (e.g. hepatitis and septicacemia),
dysfunction (e.g. Alzheimer's disease, Parkinson's disease and epilepsy),
contemporates (e.g. cystic fibrosis, asthma and emphysema), skin disease
(e.g. eczema and psoriasi), kidney disease (e.g. glomerulonephritis),
chous diseases (e.g. osteoporosis and hypercalcaemia), wascular disorders
(e.g. stroke and atheroscierosis, and hypercalcaemia), wascular disorders
(c.g. stroke and atheroscierosis, encores (e.g. leukaemia, myeloma and
miscarriage), eye disorders (e.g. infertility and
miscarriage), eye disorders (e.g. glomerulonephritis)
contemporate the presence of similar nucleic acids in samples and identify
patients needing restorative therapy The III/Trip may also be used as
antigens in the production of antibodies against the proteins and in
assays to identify modulators of expression and activity The
antigens and activity This is the amino acid sequence of human
circle the invention (e.g. the protein described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: Residues 1-288 of this sequence correspond to residues 8-296 of the sequence shown in AAU10601 which is incomplete in the specification.
                                                                                                       Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukaemia, asthma, diabetes, psoriasis and glaucoma .
                                                                                                                                                                                                                            Claim 2; Fig 1; 158pp; English.

\$ Isolated antigenic human or mouse DNAX receptor subunit-like polypeptide useful for detecting antibodies generated in response presence of increased protein levels or immunological disorders -

Claim 1; Page 25; 148pp; English.

The invention relates to primate and rodent DNAX cytokine receptor subunit (DCRS) polypeptides and the polynucleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies apable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levely of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents the human DCRSS polypeptide.

"X-ray crystal structure of arrestin from bovine rod outer segments.";
Nature 391:918-921(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -1-FUNCTION: ARRESTINISONE OF THE MAJOR. PROTEINS OF THE ROS
-(RETINAL ROD OUTER SEGRENTS); IT BINDS TO PHOTOACTIVATED-
PHOSPHORYLATED RHODDOPSIN. THEREBE APPARENTLY PREVENTING THE
TRANSDUCIN-MEDIATED ACTIVATION OF PHOSPHODIESTREASE.
-1-ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A
SHORT FORM (P44); ARE PRODUCED BY ALTERNATIVE SPLICING. THE SHORT
FORM PLAYS A ROLE IN THE PHOTOTRANSDUCTION CASCADE.
-1-TISSUE SPECIFICITY: RETINA AND PINRAL GLAND. THE P44 ISOFORM IS
LOCALIZED IN THE PHOTORECEPTOR OUTER SEGMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FEGATOR PROBLEM.

11 FUNCTION: ARRESTIN IS ONE OF THE MAJOR PROTENTS OF THE ROS (RETINAL ROD OUTER SEGNENTS); IT BINDS, TO PHOTOACTIVATED-PHOSPHORYLATED REDOPEST. THERMS TO PHOTOACTIVATED.
11 TISSUE SPECIFICITY: RETINAL AND PINRAL GLAND.
11 TISSUE SPECIFICITY: RETINAL AND PINRAL GLAND.
11 DISEASE.S ANTIGEN INDUCES AUTOIMMUNE UVEITIS.
12 MISCELLANEOUS: ARRESTIN BINDS CALCION (BY SIMILARITY).
13 SIMILARITY: BELONGS TO THE ARRESTIN FAMILY.
